- More Alarm Considerations

What Are Alarms

What is an alarm in Android?

- Not an actual alarm clock.
- Schedules something to happen at a set time.
- Fire intents at set times or intervals.
- Goes off once or recurring.
- Can be based on a real-time clock or elapsed time.
- App does not need to run for alarm to be active.

How alarms work with components

Stand Up!

Stand Up Alarm

ON

Stand Up Alarm On!

Activity creates
a notification and
sets an alarm.

Alarm triggers and
sends out Intent.
App may be
destroyed so....

BroadcastReceiver
wakes up the app
and delivers the
notification.

Benefits of alarms

- App does not need to run for alarm to be active.
- Device does not have to be awake.
- Does not use resources until it goes off.
- Use with `BroadcastReceiver` to start services and other operations.

Measuring time

- Elapsed Real Time—time since system boot.
 - Independent of time zone and locale.
 - Use for intervals and relative time.
 - Use whenever possible.
 - Elapsed time includes time device was asleep.
- Real Time Clock (RTC)—UTC (wall clock) time.
 - When time of day at locale matter.

Wakeup behavior

- Wakes up device CPU if screen is off.
 - Use only for time critical operations.
 - Can drain battery.
- Does not wake up device.
 - Fires next time device is awake.
 - Is polite.

Types of alarms

	Elapsed Real Time (ERT)—since system boot	Real Time Clock (RTC)—time of day matters
Do not wake up device	<u>ELAPSED REALTIME</u>	<u>RTC</u>
Wake up	<u>ELAPSED REALTIME WAKEUP</u>	<u>RTC WAKEUP</u>

Alarms Best Practices

If everybody syncs at the same time...

Imagine an app with millions of users:

- Server sync operation based on clock time.
- Every instance of app syncs at 11:00 p.m.

 Load on the server could result in high latency or even "denial of service"

Alarm Best Practices

- Add randomness to network requests on alarms.
- Minimize alarm frequency.
- Use `ELAPSED_REALTIME`, not clock time, if you can.

Battery

- Minimize waking up the device.
- Use inexact alarms.
 - Android synchronizes multiple inexact repeating alarms and fires them at the same time.
 - Reduces the drain on the battery.
 - Use [setInexactRepeating\(\)](#) instead of [setRepeating\(\)](#).

When not to use an alarm

- Ticks, timeouts, and while app is running—[Handler](#).
- Server sync—[SyncAdapter](#) with Cloud Messaging Service.
- Inexact time and resource efficiency—[JobScheduler](#).

AlarmManager

What is AlarmManager

- [AlarmManager](#) provides access to system alarm services.
- Schedules future operation.
- When alarm goes off, registered [Intent](#) is broadcast.
- Alarms are retained while device is asleep.
- Firing alarms can wake device.

Get an AlarmManager

```
AlarmManager alarmManager =  
    (AlarmManager) getSystemService(ALARM_SERVICE);
```

Scheduling Alarms

What you need to to schedule an alarm

1. Type of alarm.
2. Time to trigger.
3. Interval for repeating alarms.
4. `PendingIntent` to deliver at the specified time (just like notifications).

Schedule a single alarm

- [set\(\)](#)—single, inexact alarm.
- [setWindow\(\)](#)—single inexact alarm in window of time.
- [setExact\(\)](#)—single exact alarm.

More power saving options [AlarmManager](#) API 23+.

Schedule a repeating alarm

- [setInexactRepeating\(\)](#)
 - repeating, inexact alarm.
- [setRepeating\(\)](#)
 - Prior to API 19, creates a repeating, exact alarm.
 - After API 19, same as `setInexactRepeating()`.

setInexactRepeating()

```
setInexactRepeating(  
    int alarmType,  
    long triggerAtMillis,  
    long intervalMillis,  
    PendingIntent operation)
```

Create an inexact alarm

```
alarmManager.setInexactRepeating(  
    AlarmManager.ELAPSED_REALTIME_WAKEUP,  
    SystemClock.elapsedRealtime()  
        + AlarmManager.INTERVAL_FIFTEEN_MINUTES,  
    AlarmManager.INTERVAL_FIFTEEN_MINUTES,  
    notifyPendingIntent);
```

More Alarm Considerations

Checking for an existing alarm

```
boolean alarmExists =  
    (PendingIntent.getBroadcast(this,  
        0, notifyIntent,  
        PendingIntent.FLAG_NO_CREATE) != null);
```

Doze and Standby

- Doze—completely stationary, unplugged, and idle device.
- Standby—unplugged device on idle apps.
- Alarms will not fire.
- API 23+.

User visible alarms

- [setAlarmClock\(\)](#)
- System UI may display time/icon.
- Precise.
- Works when device is idle.
- App can retrieve next alarm with `getNextAlarmClock()`.
- API 21+.

Cancel an alarm

- Call `cancel()` on the `AlarmManager`
 - pass in the `PendingIntent`.

```
alarmManager.cancel(alarmPendingIntent);
```

Alarms and Reboots

- Alarms are cleared when device is off or rebooted.
- Use a `BroadcastReceiver` registered for the `BOOT_COMPLETED` event and set the alarm in the `onReceive()` method.
